TD n° 7 : Typed λ -calculus

Exercise 1 :

Show that if $x_1 : A_1, \dots, x_n : A_n \vdash M : B$ is derivable then $(A_1 \rightarrow \dots (A_n \rightarrow B) \dots)$ is a *tautology* of propositional logic where we interpret \rightarrow as implication and atomic types as propositional variables. Conclude that there are types A which are *not inhabited*, i.e., there is no (closed) λ -term M such that $\emptyset \vdash M : A$.

Exercise 2 :

Show that there is no λ -term M such that $\emptyset \vdash M : (b \rightarrow b) \rightarrow b$. Write $A \rightarrow b$ as $\neg A$. Show that there are λ -terms N_1 and N_2 such that :

$$\emptyset \vdash N_1 : A \rightarrow (\neg \neg A) , \quad \emptyset \vdash N_2 : (\neg \neg \neg A) \rightarrow (\neg A) .$$

On the other hand, there are tautologies which are not inhabited ! For instance, consider : $A \equiv ((t \rightarrow s) \rightarrow t) \rightarrow t$. Show that there is no λ -term M in normal form such that $\emptyset \vdash M : A$ is derivable. This is enough because later we will show that all typable λ -terms normalize to a λ -term of the same type. For another example, show that there is no λ -term M in normal form such that $\emptyset \vdash M : \neg \neg t \rightarrow t$ is derivable (the intuitionistic/constructive negation is not involutive!).

Exercise 3 :

Suppose we reconsider the *non-logical extension* of the simply typed λ -calculus with a *basic type nat*, constants Z, S, Y , and with the following fixed-point rule :

$$C[YM] \rightarrow C[M(YM)] .$$

Let a *program* be a closed typable λ -term of type *nat* and let a *value* be a λ -term of the shape $(S \dots (SZ) \dots)$. Show that if P is a program in *normal form* (cannot reduce) then P is a *value*.

Exercise 4 :

Assume a *recursively defined type* t satisfying the equation $t = t \rightarrow b$ and suppose we add a rule for typing up to type equality :

$$\frac{\Gamma \vdash M : A \quad A = B}{\Gamma \vdash M : B} .$$

Show that in this case the following λ -term (Curry's fixed point combinator) is typable (e.g., in Curry's style) :

$$Y \equiv \lambda f.(\lambda x.f(xx))(\lambda x.f(xx)) .$$

Are the λ -terms typable in this system terminating ?
